

The “Nautilus Snail”: Inspired by cephalopods in the Pacific Ocean

This special form of conveying water with the Nautilus Snail was not inspired by Captain Nemo's submarine but by the spiral-shaped inner housing of the 'Nautilus Pompilius': This mollusc belongs to the class of cephalopods that live in the western Pacific, with some of them also being found in the Indian Ocean. It is related to the octopus.

When the large disc is turned, the spiral conveyor mounted on it starts to take up the water and discharge it out of the back via the central hub. The maximum discharge height corresponds to the radius of the wheel. The Nautilus Snail is an attractive supplement to water play systems. Designed for children from the age of five, it promotes and demands physical activity and strength. Theme parks, water landscapes, large water playgrounds and open-air swimming pools are particularly suitable play spaces.
